

FAZIA Housing ERP — Client MVP Manual

What this document is: A simple guide to the system as built today (Modules 0–7).

Who it is for: Client stakeholders reviewing the MVP demo.

What it is not: Full construction / billing / store software yet — those come in later modules.

1. What you are looking at (in plain words)

FAZIA Housing is an ERP for managing large housing projects.

This MVP already lets you:

1. Sign in securely
2. Manage users and roles (who can do what)
3. Set up your organization tree (HQ → Region → Site, etc.)
4. Create projects and assign members
5. Break a project into **Phases** → **Sectors** → **Blocks**
6. Define **house types** and **templates**
7. Register **houses**, import them from CSV, and open a house detail page

Think of it as the **foundation of the project**: organization, projects, structure, and the house register.

2. How the system is organized (7 modules)

Module	Name	What it does for you
0	Foundation	The app shell, menus, and technical base
1	Authentication	Login, logout, forgot password
2	User Management	Create and manage staff accounts
3	Roles & Permissions	Control what each role can see and do
4	Organization	Your official org hierarchy
5	Projects	Housing projects, members, settings, dashboard
6	Project Structure	Phases, sectors, and blocks under each project
7	Houses	House types, templates, house register, import, house detail

Coming later (not in this demo): Contractors, full BOQ execution, site activities, inspections, store/materials, RAR, payment vouchers, reports inbox, etc.

In the menu, **Store / Billing / Reports / Inbox / Admin** are visible but **disabled** on purpose.

3. How to open and sign in

1. Open the application URL (example for local demo: `http://localhost:3000`).
2. You will see **Sign in to FAZIA Housing**.
3. Enter **Email** and **Password**.
4. Click **Sign in**.

If you forget the password, use **Forgot password?** (email reset flow).

Demo tip: Use the Super Admin account prepared for the demonstration (your team will share the email/password). Super Admin can open every screen in this MVP.

4. Main menu (left / navigation)

Menu item	What you use it for	Available now?
Overview	Home / landing after login	Yes
Users	Staff accounts	Yes
Roles	Roles and permissions	Yes
Organization	Org units tree	Yes
Projects	All housing projects	Yes
House types	Types & templates catalog	Yes
Store / Billing / Reports / Inbox / Admin	Future modules	No (disabled)

5. Suggested client demo walkthrough (15–20 minutes)

Follow this order — it matches how real data should be created.

Sign in
→ Organization (optional)
→ Projects → Create project
→ Project → Structure (Phase → Sector → Block)
→ House types (create type + template)
→ Project → Houses (create or import houses)
→ Open one house (detail page)
→ Project → Dashboard (see counts)

6. Module-by-module: what was made & how to use it

Module 1 — Sign in

Made: Secure login session, logout, password reset pages.

How to use:

- Sign in with email/password
- Use the account menu to sign out when finished

Module 2 — Users

Made: User directory for staff accounts.

How to use:

1. Open **Users**
2. Invite / create users as your admin process allows
3. Activate or deactivate accounts when people join or leave

(Exact buttons depend on your role permissions.)

Module 3 — Roles & Permissions

Made: Role-based access control. Screens and actions respect permissions.

How to use:

1. Open **Roles**
2. Review system roles (examples: Super Admin, Resident Engineer, Finance, Store Officer, ...)
3. Assign roles to users so each person only sees what they need

Client note: Even if a button is hidden for one role, Super Admin can demonstrate the full flow.

Module 4 — Organization

Made: Hierarchical organization units.

How to use:

1. Open **Organization**
2. Switch **Tree** or **Table** view
3. Click **Add unit**
4. Fill: **Code, Name, Type, Status, Parent**
5. Save

Types available: HQ, Region, Division, Site, Office, Store, Finance, Other

You can open a unit to edit it and assign users to that unit.

Module 5 — Projects

Made: Project list, project detail with five tabs, members, settings, dashboard summary.

A. Create a project

1. Open **Projects**
2. Click **Create project**
3. Fill the required details and save
4. Open the project from the list

B. Project tabs (important)

Inside a project you will see:

Tab	Purpose
Dashboard	Snapshot of the project (counts, members, activity)
Structure	Phases / sectors / blocks
Houses	House register for this project

Members	Who can work on this project
Settings	Project name, status, manager, location, etc.

C. Members

1. Open **Members**
2. **Add member**
3. **Remove** when needed

D. Settings

You can update fields such as: **Name**, **Status**, **Project type**, **Priority**, **Client / owner**, **Consultant**, **Main contractor**, **Fiscal year**, **Organization unit**, **Project manager**, **Description**, **Location**, **Currency**, **Timezone**, GPS, logo URL, internal notes.

E. Archive

Use **Archive** if a project should become read-only. Use **Restore** to bring it back.

Module 6 — Project Structure (Phases, Sectors, Blocks)

Made: Nested structure under each project.

Hierarchy (always remember this):

```

Project
├── Phase
│   ├── Sector
│   │   ├── Block
│   │   │   └── Houses (Module 7 live here)

```

How to use:

1. Open a project → **Structure** tab
2. Select where you want to add the next level
 - On the project → create a **Phase**
 - On a phase → create a **Sector**
 - On a sector → create a **Block**
3. Enter **Name** (and optional **Code** — code can auto-generate)
4. Click **Create ...**

Bulk create: Paste many names (one per line) and use **Bulk create**.

You can also search, filter by status, and **Archive / Restore / Delete** structure items (with safety checks).

Module 7 — House Types, Templates & Houses

This is the heart of the housing register MVP.

A. House types & templates (menu: **House types**)

What it is:

- A **House type** = typology (e.g. Type A residential)
- A **Template** = reusable definition for that type (versioned)

- Template lines = planned **Activities, BOQ items, Materials** (definitions only for now)

Create a house type:

1. Open **House types**
2. Under **Add house type**, enter **Name** (and optional **Code**)
3. Choose category: Residential / Commercial / Mixed / Other
4. Click **Create type**

Create a template:

1. Click a house type on the left
2. Under **Add template**, enter **Template name**
3. Click **Create template**
4. Click the template to open its detail

Add template lines:

- **Add activity** (name, qty, unit)
- **Add BOQ item**
- **Add material**

Create a new version:

- Enter a **Revision note** → **Revise template**
- Old version is archived; new version keeps a history chain

Important for the client: These template lines are **definitions for later construction modules**. The system does **not** yet run site execution, costing, or payment from them.

B. Houses inside a project (Houses tab)

What you see at the top: counts for **Total, Planning, Completed, Types**.

Filters: Phase, Sector, Block, Type, Status.

Create one house:

1. Project → **Houses**
2. Choose **Phase, Sector, Block, House type**
3. Optionally choose a **Template**
4. Optional **Code** and **Plot number**
5. Click **Create house**

Import many houses (CSV):

1. Paste CSV in the import box
2. Required style headers:

```
phase,sector,block,type,code,plot,template,owner,notes
```

Example:

```
phase,sector,block,type,code,plot
PH-001,SEC-A,BLK-01,HT-001,HSE-001,P-12
```

- 3. Click **Dry run** first (checks errors and duplicates — **no data written yet**)
- 4. Review the summary / error report
- 5. If clean, click **Commit import**
- 6. If commit fails mid-way, the system rolls back those rows

Open a house:

- Click the house code in the table → opens **House detail**

C. House detail page

Tabs:

Tab	Status in MVP
Overview	Working — status, type, template, owner, notes
Location	Working — phase/sector/block, plot, GPS
Template	Working — assigned template summary
Timeline	Working — status change history
History	Working — created/updated + status history
Documents	Placeholder (future)
Activities	Placeholder (future execution)
BOQ	Placeholder (future)
Materials	Placeholder (future)

7. Project Dashboard — what the numbers mean

On **Dashboard** you will see:

Real today

- Houses / Phases / Sectors / Blocks counts
- House types count
- Planning / Completed house counts
- Project summary, members, deadlines, recent activity

Placeholders (shown as 0 / “placeholder” until later modules)

- Construction progress %, Activities, BOQ, Materials, Budget
- Contractors, Employees, Inventory, Open IRs
- Workflow tasks, Documents, Notifications cards

This is intentional: the cards show where future KPIs will appear.

8. Permissions (simple explanation)

Role example	Typical use in demo
--------------	---------------------

Super Admin	Full demo of everything built
Resident Engineer	Project / houses / structure oriented
AD Tech	House types / technical masters
Other roles	Seeded for later modules

If a screen is empty or a button is missing, the signed-in role may not have that permission. Switch to Super Admin for a full tour.

9. What this MVP proves to the client

You can already:

- Control access with login + roles
- Mirror the real organization
- Open and manage housing projects
- Build Phase → Sector → Block structure
- Define house typologies and versioned templates
- Register houses in bulk with safe dry-run import
- Inspect each house on a dedicated detail page
- See live structure and house KPIs on the project dashboard

That is the **project master data backbone** required before contractors, site progress, store, RAR, and payments.

10. What is intentionally not in this demo

Please do not expect these yet (architecture is ready; build is later):

- Contractor management
- Live construction activity tracking on site
- Full BOQ costing engine
- Yard Stick / RAR / Payment Voucher
- Measurement Book & government payment documents
- Store, GRN, material issue
- Full reports / inbox / notifications vault

Greyed menu items are reserved for those phases.

11. Quick troubleshooting during the demo

Problem	What to try
Cannot open a page	Confirm Super Admin (or correct permission)
Cannot create a house	Create Phase → Sector → Block first, then a House type
CSV import blocked	Run Dry run , fix error report (wrong phase/sector/block/type codes or duplicate house codes)
Project looks read-only	It may be Archived — use Restore

Template lines don't change house progress	Expected — execution modules are not built yet
---	--

12. One-page cheat sheet

LOGIN → Projects → Create Project
→ Structure: Phase → Sector → Block
→ House types: Type → Template → (optional lines)
→ Houses: Create or Dry run + Commit CSV
→ Click house → Overview / Location / Timeline
→ Dashboard → review live counts
